Team Assignment #1 Readme

To start out both Gavin and I made really short and dirty replicating programs to get our thoughts out. Very simple and straight forward, both were only a few lines long, utilizing the formatting special characters in java as well as the printf() statement. They both were very similar. Then we wanted to attempt the extra credit, so Collin whipped up a great solution for that. We then just cleaned it up a little and got a good final solution. It works when ran on the command line. It has no shortcomings. It replicates its own source code and then creates 5 "replication" .java and .class files in the current directory. Had to keep track of iterations as you will see in the output file, so that it would not run forever. Overall pretty simple and fun assignment.
